A tool for representation, editing and distribution of LABS/Q® documents

Brief description

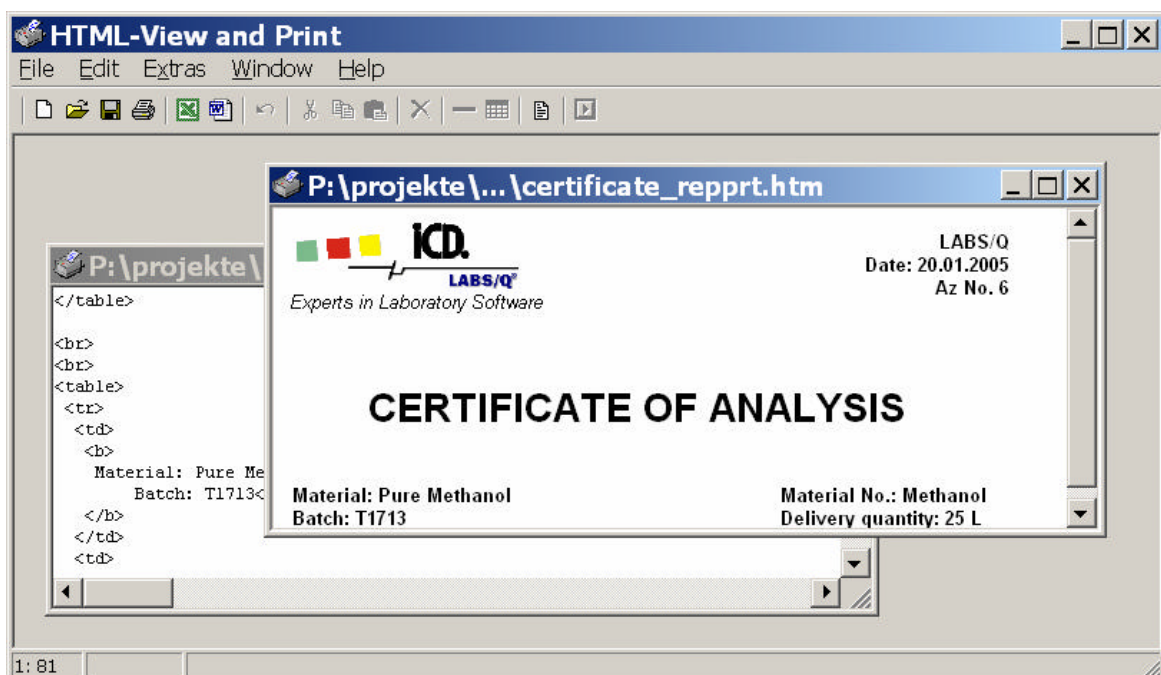

The HTML Viewer is a tool for viewing, printing, faxing, emailing and editing of those report files that have been generated by LABS/Q®. The viewer supports multi-document handle which means several documents can be edited or displayed simultaneously.

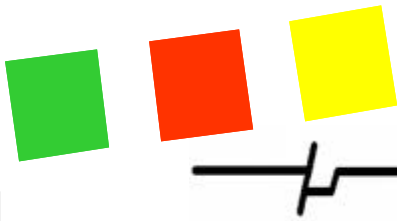

Starting from the LABS/Q® application you can display, edit or send documents in various electronic ways. No matter, if you need to print, email or fax your documents, the HTML Viewer offers flexible solutions for all of these tasks.

Printing in landscape format

Usually, a HTML document will be printed in the panel format. However, by applying simple control settings it is possible to switch between panel and landscape format.

Depending on the design of your documents the landscape format might be the better choice in several situations. By setting the corresponding command in your report template you can easily switch the document generation in a very flexible way to get the desired representation format.

Including graphics

HTML files may contain graphics in the GIF, JPG and BMP format by using hyperlinks with relative or absolute file paths.

In order to arrange your documents in a more pleasing way instead of working just with dry texts and tables, the HTML Viewer offers to you the possibility to include graphics and pictures of the mentioned file formats into the document.

Including of MS Excel and MS Word

It is possible to export the current report file manually or automatically to MS Excel or MS Word. For further processing of your data you may even execute user-defined macros or VBA (Visual Basic for Applications).

Queries and documents generated by the LABS/Q[®] system can be easily transferred into EXCEL or WORD just by a simple button click in your HTML viewer. There will be no need of exhausting manual data transfer into text paragraphs or tables. Through this, you may continue arranging your documents in well-known applications.

Multilingualism

By default the HTML Viewer supports the two languages English and German. However, extending to further languages (e.g. Spain, Italian, French, Thai, Chinese) is available anytime.

According to your accustomed environment you can choose your preferred language for the user interface. Thus, you do not need to change over to unfamiliar user interfaces.

Printing of header and footer

The HTML Viewer supports printing of individual header and/or footer lines. The tool distinguishes between header/footer for the first page and for following pages. Header and footer lines can contain both, texts as well as graphics.

Using the HTML Viewer, you can easily include your own corporate logo or fixed user-defined headers and footers into your forms and reports. This will ensure a uniform layout of your print-outs.

System requirements

Windows 2000, Windows NT 4.0, Windows 98

MS Word 2000 or Excel 97/Excel 2000 when starting Word or Excel from the HTML Viewer application.

If you send PDF documents via email, Adobe Acrobat in version 4.0 or up is required. For viewing PDF documents you need the Adobe Acrobat Reader in version 4.0 or up. For faxing of documents the software FaxMaker (www.faxmaker.com) will be used.

Nowadays, these system requirements will be met almost everywhere. Therefore, you won't have any additional installation effort, if you take your decision for the HTML Viewer.
